# KERBEROS

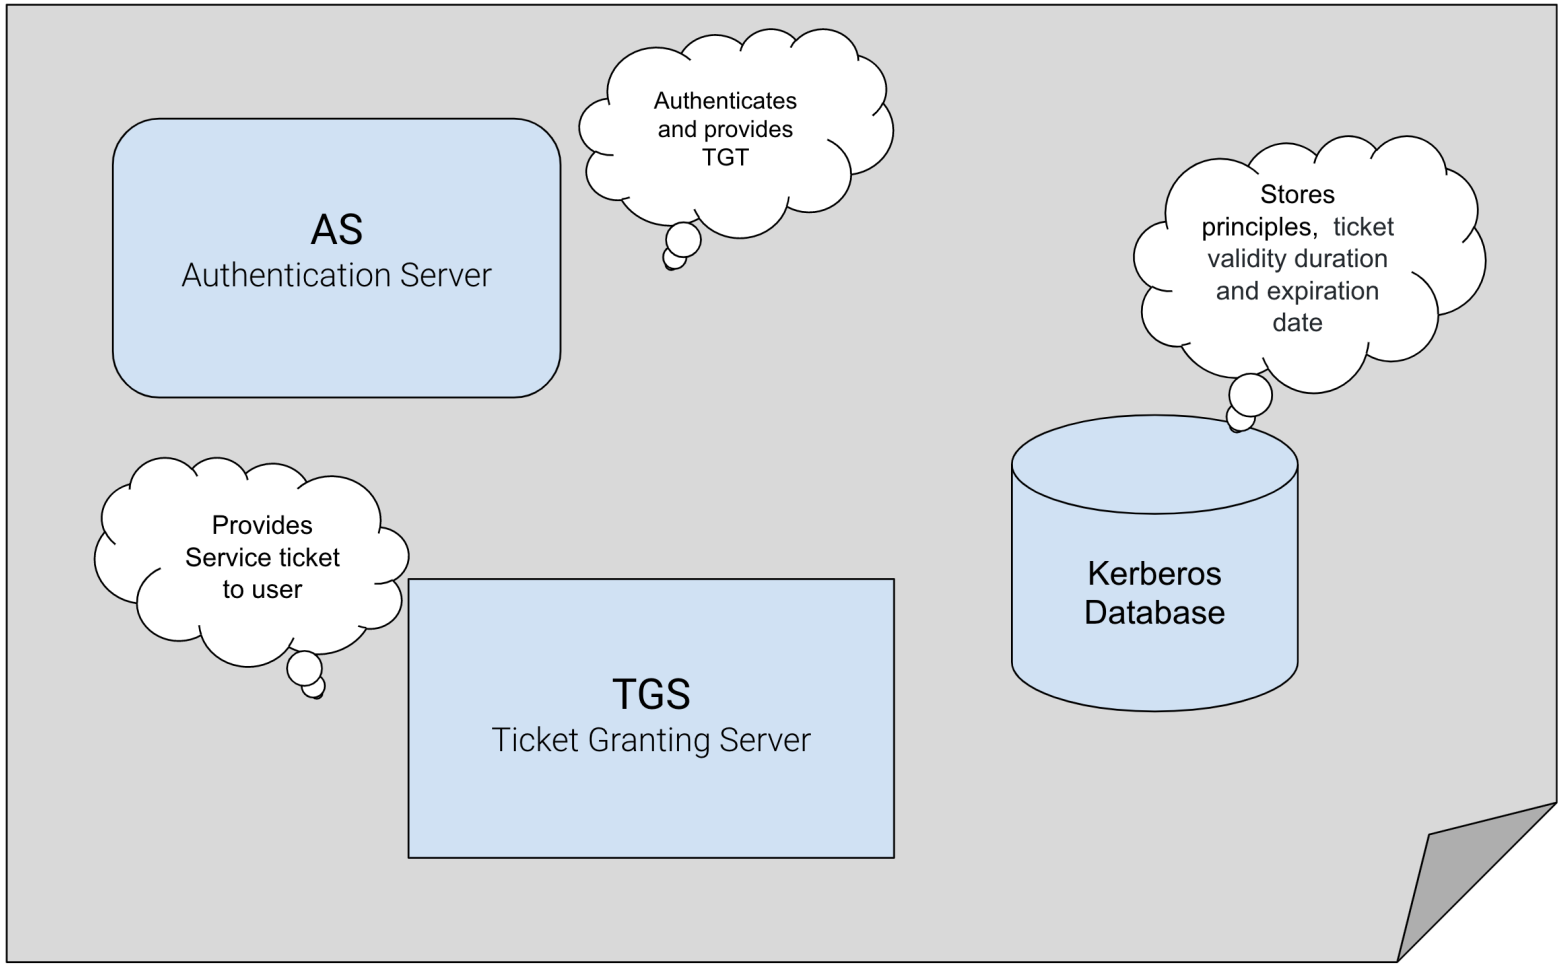
NETWORK AUTHENTICATION PROTOCOL

# About Kerberos

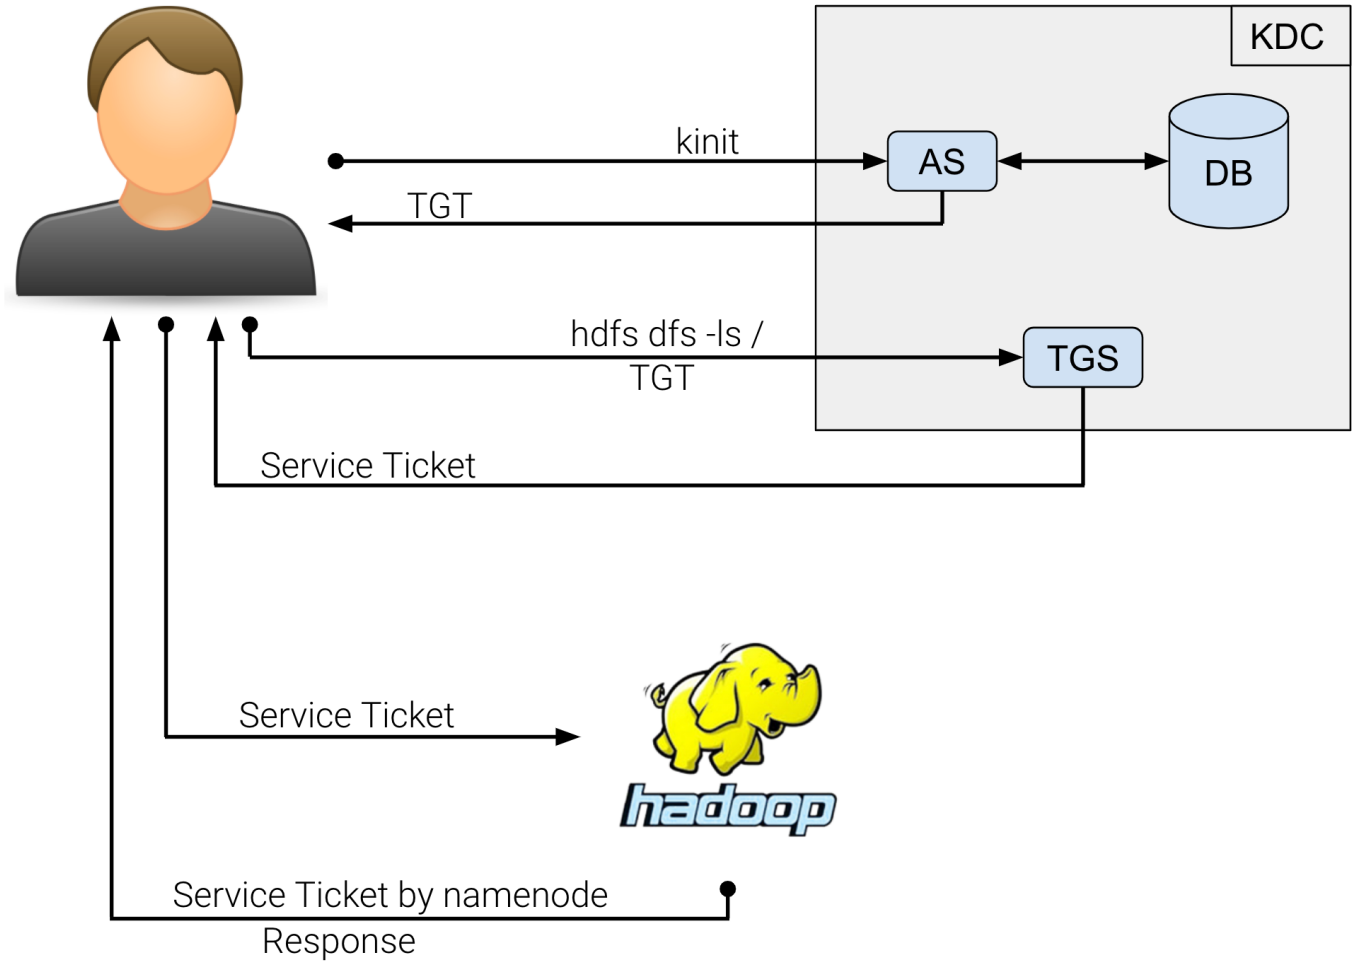
- Kerberos is a network authentication protocol developed by MIT.
- which eliminates the need for transmission of password across the network and removes the threat of any attack.

# KDC

## Key Distribution Center



# How Kerberos Works



# Installation of Kerberos

- Install Kerberos workstation on **all hosts** of the cluster using the following command:

```
yum install krb5-workstation krb5-libs krb5-auth-dialog
```

- Install Kerberos Server on any one host of the cluster:

```
yum install krb5-server
```

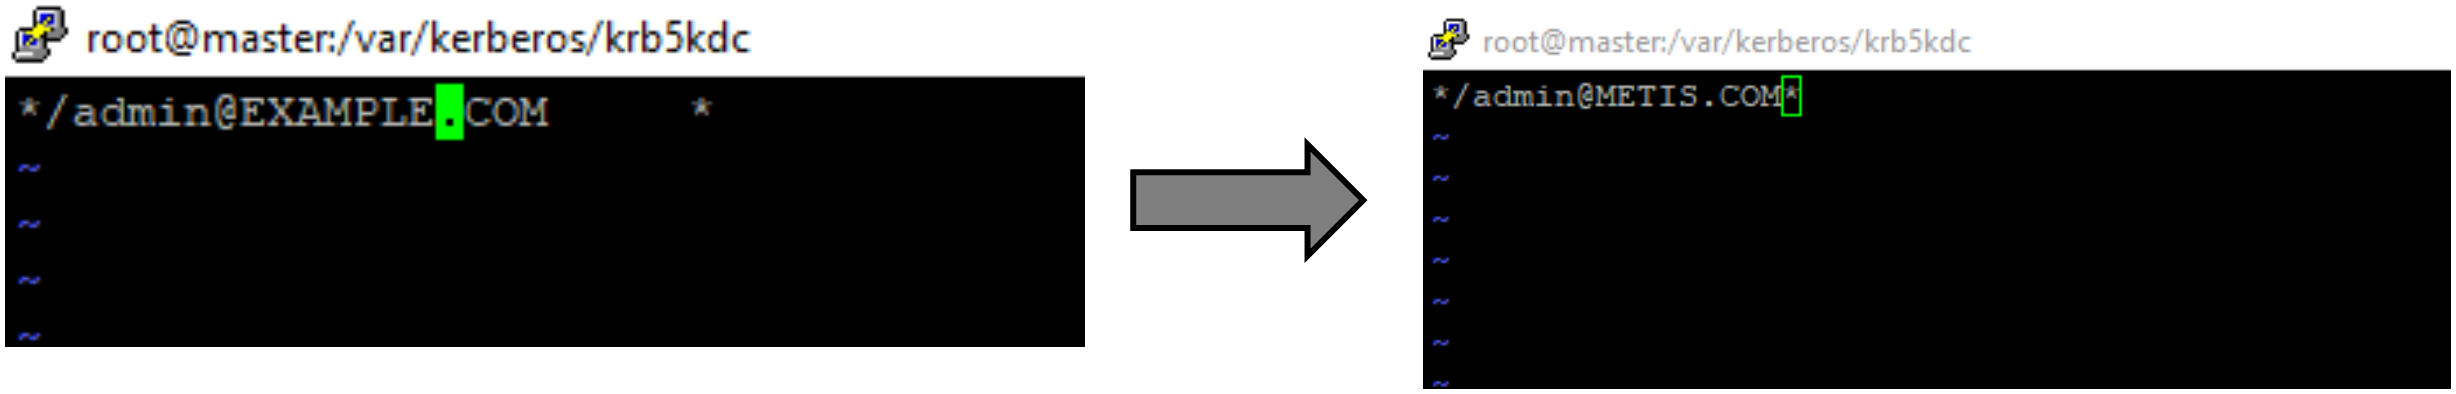
# Configuring kadm5.acl

Perform this step only on the host in which Kerberos server is installed

- To configure kadm5.acl file, use the following command:

```
vi /var/kerberos/krb5kdc/kadm5.acl
```

- Make the following changes as shown below:



# Configuring kdc.conf file

Perform this step only on the host in which Kerberos server is installed

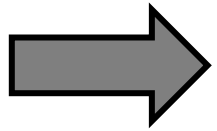
- To configure kdc.conf file, use the following command:

```
vi /var/kerberos/krb5kdc/kdc.conf
```

- Make the following changes as shown below:

```
[kdcdefaults]
 kdc_ports = 88
 kdc_tcp_ports = 88

[realms]
 EXAMPLE.COM = {
  #master_key_type = aes256-cts
  acl_file = /var/kerberos/krb5kdc/kadm5.acl
  dict_file = /usr/share/dict/words
  admin_keytab = /var/kerberos/krb5kdc/kadm5.keytab
  supported_enctypes = aes256-cts:normal aes128-cts:normal des
c:normal
 }
~
~
~
```



```
[kdcdefaults]
 kdc_ports = 88
 kdc_tcp_ports = 88

[realms]
 METIS.COM = {
  #master_key_type = aes256-cts
  acl_file = /var/kerberos/krb5kdc/kadm5.acl
  dict_file = /usr/share/dict/words
  admin_keytab = /var/kerberos/krb5kdc/kadm5.keytab
  supported_enctypes = aes256-cts:normal aes128-cts:normal de
c:normal
 }
~
~
```

# Configuring krb5.conf file

Perform this on all the hosts of the cluster

- To configure krb5.conf file, use the following command:

```
vi /etc/krb5.conf
```

Make the following changes as shown below:

```
# Configuration snippets may be placed in this directory as well
includedir /etc/krb5.conf.d/

[logging]
 default = FILE:/var/log/krb5libs.log
 kdc = FILE:/var/log/krb5kdc.log
 admin_server = FILE:/var/log/kadmind.log

[libdefaults]
 dns_lookup_realm = false
 ticket_lifetime = 24h
 renew_lifetime = 7d
 forwardable = true
 rdns = false
 pkinit_anchors = FILE:/etc/pki/tls/certs/ca-bundle.crt
# default_realm = EXAMPLE.COM
 default_ccache_name = KEYRING:persistent:%{uid}

[realms]
# EXAMPLE.COM = {
#  kdc = kerberos.example.com
#  admin_server = kerberos.example.com
# }

[domain_realm]
# .example.com = EXAMPLE.COM
# example.com = EXAMPLE.COM
~
~
```

```
# Configuration snippets may be placed in this directory as well
includedir /etc/krb5.conf.d/

[logging]
 default = FILE:/var/log/krb5libs.log
 kdc = FILE:/var/log/krb5kdc.log
 admin_server = FILE:/var/log/kadmind.log

[libdefaults]
 dns_lookup_realm = false
 ticket_lifetime = 24h
 renew_lifetime = 7d
 forwardable = true
 rdns = false
 pkinit_anchors = FILE:/etc/pki/tls/certs/ca-bundle.crt
 default_realm = METIS.COM
 default_ccache_name = KEYRING:persistent:%{uid}

[realms]
 METIS.COM = {
 kdc = master.metis.com
 admin_server = master.metis.com
}

[domain_realm]
 metis.com = METIS.COM
 metis.com = METIS.COM
~
```

# Create Database

Perform this step only on the host in which Kerberos server is installed

- To create a Kerberos database, use the following command and set the master password:

```
kdb5_util create -r METIS.COM -s
```

- After running the following command, it will ask you to set a master password.

# Start Kerberos services

Perform this step only on the host in which Kerberos server is installed

- Use the following commands on the host in which Kerberos server is installed to start the services:

```
systemctl start krb5kdc
```

```
systemctl start kadmin
```

# Install JCE policy files

Perform this on all the hosts of the cluster

- To install JCE Policy files, use the following wget command to download the required file:

```
wget --no-check-certificate --no-cookies --header "Cookie: oraclelicense=accept-securebackup-cookie" "http://download.oracle.com/otn-pub/java/jce/8/jce_policy-8.zip"
```

- Now use the following command to unzip the file on the correct directory:

```
unzip -o -j -q jce_policy-8.zip -d /usr/java/jdk1.8.0_141-cloudera/jre/lib/security/
```

# Adding Principal

Perform this step only on the host in which Kerberos server is installed

- To add principal, use the following command to enter the kadmin CLI to add the required principle:

```
kadmin.local
```

- Once entered the kadmin.local CLI, use the following command to add the principal named **root/admin:**

```
addprinc root/admin
```

- Once that is done, it will ask you to set the password for the principle

# Listing all Principals

Perform this step only on the host in which Kerberos server is installed

- To add principal, use the following command to enter the kadmin CLI to list all principals:

```
kadmin.local
```

- Once entered the kadmin.local CLI, use the following command to list the principals :

```
listprincs
```

- Once that is done, it will ask you to set the password for the principle

# Getting Kerberos Ticket (TGT)

- Use the following command to get the Kerberos ticket for the principal root/admin:

```
kinit root/admin
```

# View Kerberos Tickets (TGT)

- Use the following command to view the Kerberos tickets available for the current user:

```
klist
```

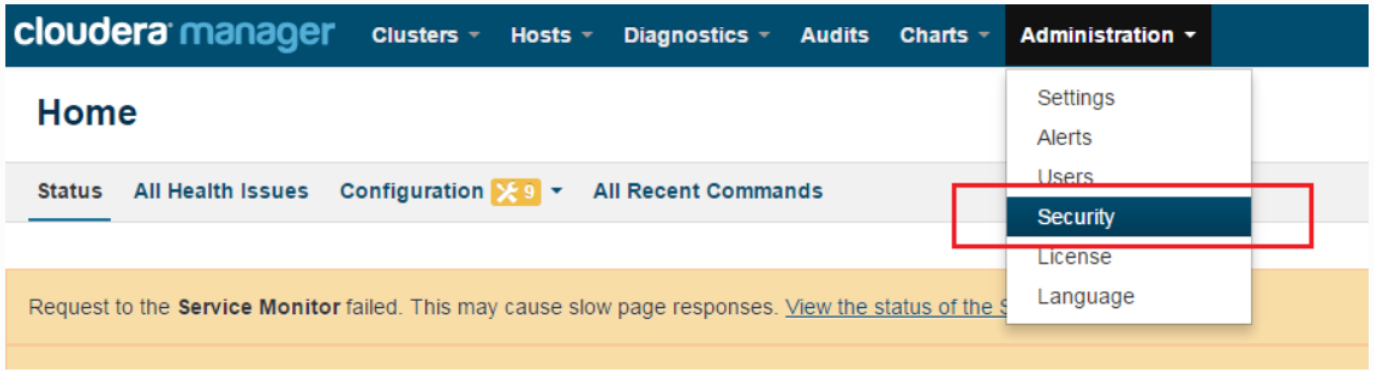
# Delete all Kerberos tickets (TGT)

- To delete all the tickets for the current user, log in as the user and run the following command:

```
kdestroy
```

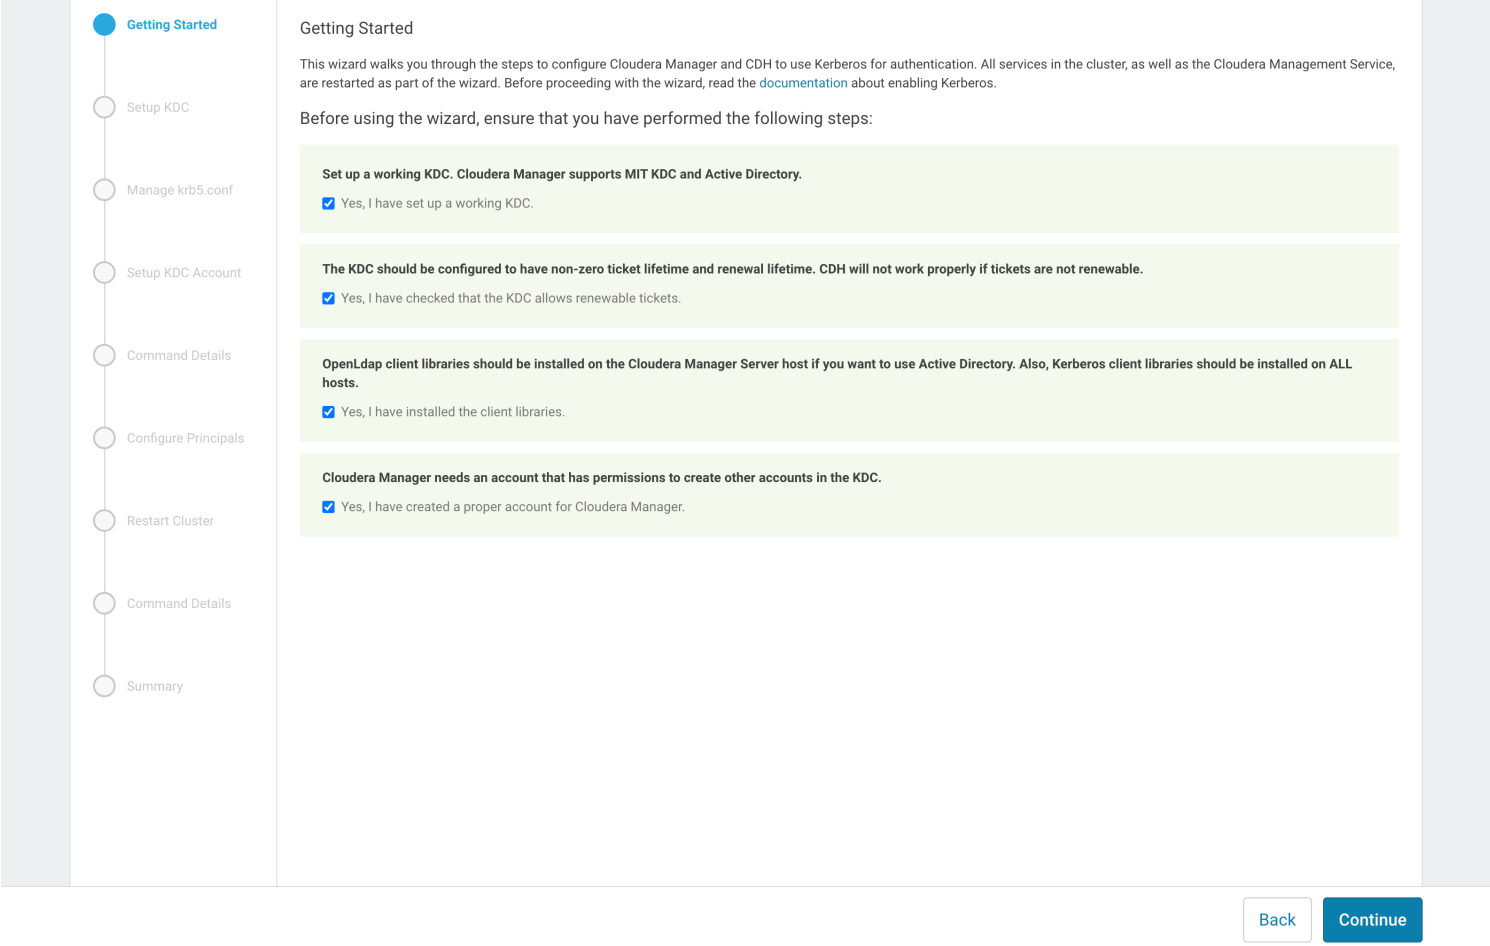
# Enabling Kerberos on Cloudera Manager

1. Login to Cloudera Manager and Select Security option from Administration tab.

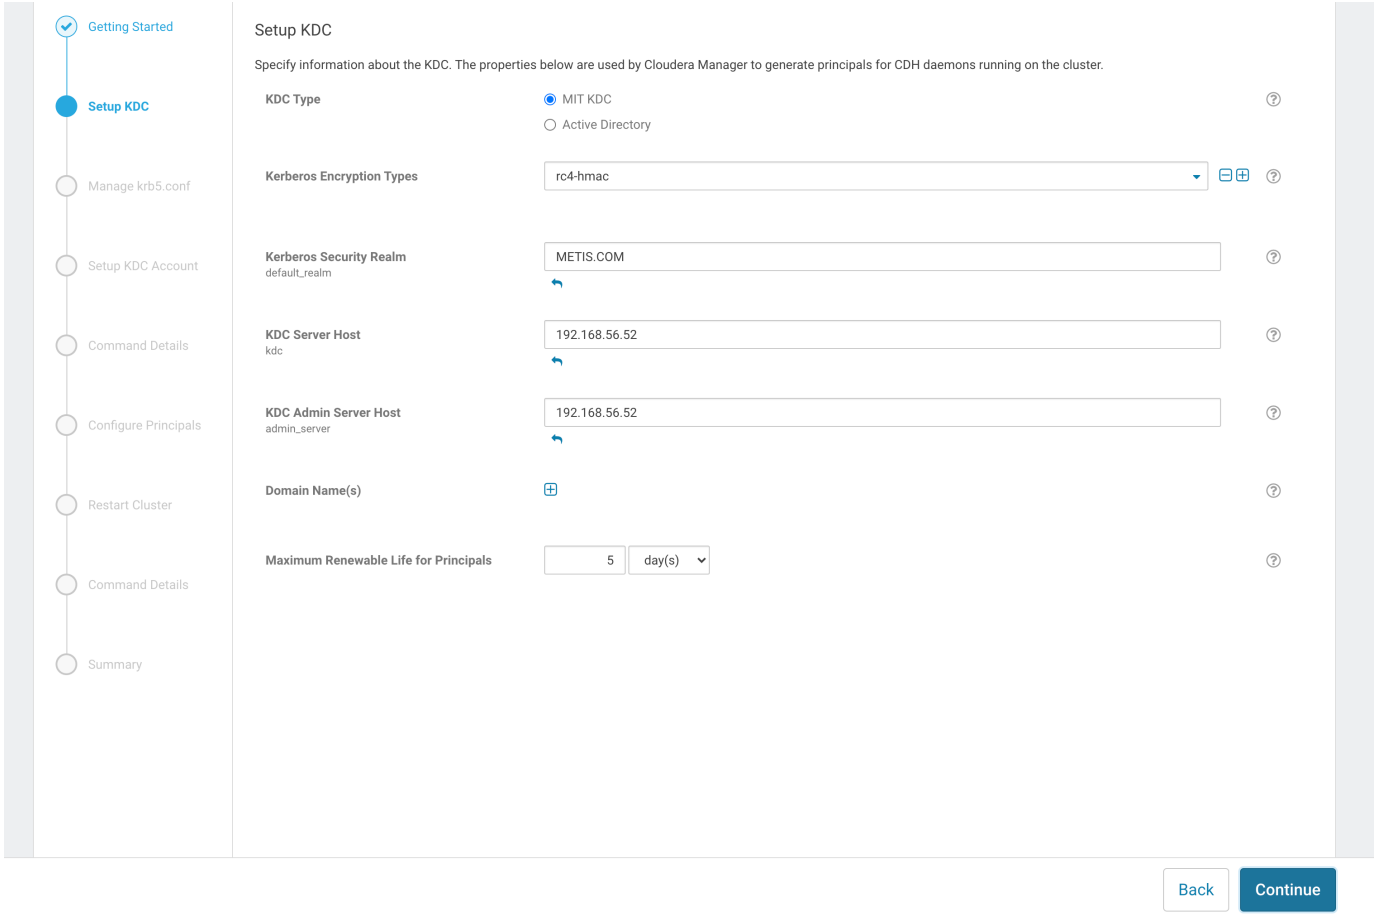


2. Click on Enable Kerberos.

# Getting Started



# Setup KDC



Getting Started
Setup KDC
Manage krb5.conf
Setup KDC Account
